Introduction

Scope and purpose of document

This project plan document outlines the structure, scope, and organization of the Notes App project. It details the project schedule, staff organization, and tracking and control mechanisms to ensure successful completion.

Responsibilities are clearly assigned among team members, and tools such as GitHub, Trello, Google Drive, and Slack are used for collaboration and project management. Overall, the purpose of this project plan is to serve as a structured roadmap that defines the goals, responsibilities, and coordination methods for the development of our app.

The Notes App is an application intended for mobile use and designed to provide a streamlined and efficient note-taking experience without requiring a computer. Unlike many traditional text editors that are poorly optimized for mobile devices, this app prioritizes usability and accessibility. It allows users to view and edit multiple file types such as PDF, TXT, and Markdown, includes built-in real time language translation with automatic language detection, and features keyword mapping for quick referencing and custom redirects. The app also offers multiple sorting options for organizing notes and comprehensive customization capabilities, including themes, layouts, tab sizing, and folder positioning, giving users full control over their workspace.

System Scope

Problem/Opportunity Description

The problem with many notetaking applications on mobile devices is that they are generally designed with desktop/laptop usage in mind, making mobile portability an afterthought with very minimal effort. We are designing our app with ease and efficiency on mobile being the foremost priority. We are planning to solve this problem by creating a notetaking app with a mobile-driven focus in mind. People may find themselves in situations where their everyday life could be made much easier if they could use their phone to open/edit documents of common file types that are often present in many

professional situations.

Anticipated Business/Personal Benefits

A free to use base app that will not require any in-app purchases

Increased cloud storage - base cloud storage will face limitations that could be bypassed through in-app purchases, providing users with greater cloud based storage capacity

Live translation - although translation will be a feature, a document will need to be saved manually to be translated via the free version. With a one time payment this feature can occur more often and faster as the document will save more often and translation will be done as the document is edited

Ad-Space - Without payment, users will occasionally see ads that they will be able to close after roughly ~5-10 seconds

System Capabilities

Keywords with their own pages - This function will allow the user to type in a certain word/phrase that will link to a note page that they assign it to. Along with this, the user will be able to link words to outside sources.

UI customization - This function will allow the user some customization to make the pages have their own style, and to take notes in their own way.

Formatting file types - This function will allow the user to paste in a file (.docx, .txt, .pdf) that will be automatically made into edit-able text.

Translation - This function will translate the desired text into the language the user chooses.

Sorting - This function will allow the user to sort their notes as they please. They will be able to sort as usual by date, or name, but will also

add new sorting features, like being able to drag/drop/pin whatever files wherever they want.

System Context

Located in GitHub files (SCD.drawio)

Schedule

Located in GitHub files (ProjectSchedule.xml)

Staff Organization

Our team leader is Donald, and we're organized by having our own GitHub repository, Trello workspace, Google Drive folder that this outline is in, Slack channel, and canvas on Slack with links to GitHub and Trello. Donald has shown the most team leadership traits so far by creating what's on GitHub, Trello, and Google Drive, and sharing them with the rest of us soon afterwards.

Tracking and control mechanisms

Trello - Keeping track of all tasks and who is assigned to do what tasks

Slack - Communication tool to keep in contact with one another and ensure that everyone is on track and completing whatever it may be that they are supposed to do

Google Workspace - Free and easy to use cloud-based workspace that allows all group members to work on and access any document simultaneously

Microsoft Project/Visio/drawio - Most up-to-date and efficient planning and system diagram creation tools at our disposal to plan ahead and stay focused on the task at hand

GitHub - Upload all finished work for review and comments
